

Crypto Presale Tracker

How to Use — Simple Guide

Made by ArtX

What is this?

This is a simple tool to help you keep track of your cryptocurrency presale transactions across multiple wallets. You can log each transaction, see what you spent, and export a clean Excel file — all without needing any account, internet connection, or technical knowledge.

Everything runs directly in your web browser. Nothing is uploaded or shared anywhere.

Getting Started

Open the file called `crypto_tracker.html` in any web browser (Chrome, Firefox, Edge — any works). That's it. No installation needed.

1

Name your wallet

Click the wallet name at the top (it says "Wallet 1" by default) and type a name you'll recognise, e.g. "First or second Double" or "Main Wallet".

2

Add your wallet address

Paste your wallet address into the field below the name. This is your public blockchain address (starts with 0x for Ethereum, or TR for Tron, etc.). This is just for your records.

3

Add a transaction

Copy a transaction hash or the full link from your blockchain explorer (Etherscan, Tronscan, etc.) and paste it into the main input box. Press Enter or click Add.

4

Fill in the details

The chain is detected automatically. Just fill in the Date and USD Value. Then click Add Manual Entry.

5

Export your Excel

Once all transactions are logged, click Generate Excel Report at the bottom. A .xlsx file downloads to your computer with everything organised.

Adding Transactions — Tips

- **Paste a full URL** from Etherscan or Tronscan and the chain is detected automatically.
- **Or paste just the raw hash** (the long string of letters and numbers).
- **After pasting**, you'll see the full hash displayed in green — this confirms it was captured.
- **If you paste the same hash twice**, you'll get a warning: "This transaction has already been logged." Nothing duplicates.
- **Use the Manual button** if you want to enter a transaction without a hash (e.g. if you don't have the link handy).

My chain is not in the list — what do I do?

The tool supports the most common chains automatically. But if you used a chain that isn't listed, here's what to do:

1

Click Manual

Click the Manual button on the wallet to open the entry form.

2

Select "Other" from the Chain dropdown

Scroll to the bottom of the Chain list and choose Other. A new text box will appear directly below it.

3

Type your chain name

Type the name of your chain in that box — for example: Arbitrum, Sei, Sui, Near, or any other. This name will appear in your Excel export exactly as you type it.

4

Token field appears too

When Other is selected, a Token field also appears. Use this to note the coin (e.g. USDT, ETH, NEAR). This is optional but useful for your records.

The hash display and duplicate detection still work normally even when using Other. The only difference is the chain name comes from what you type.

Managing Multiple Wallets

- **+ Add Another Wallet** at the bottom to create a new wallet section.
- Each wallet has its own name, address, and transaction list.
- **remove a wallet**, click the Remove button on that wallet.
-  **padlock icon** to lock a wallet when you're done editing it. Locked wallets can't have transactions added by accident. Click again to unlock.

 You can have as many wallets as you need — the export will create a separate tab in Excel for each one.

The Excel Export

Click Generate Excel Report to download your file. Here's what you'll get:

- **One tab per wallet** — each wallet gets its own separate sheet.
- **Wallet name and address** shown at the top of each sheet.
- **Columns:** Date · Chain · Transaction Hash (clickable link) · USD Value.
- **Transactions sorted by date** — oldest first, regardless of the order you entered them.
- **Bold green TOTAL SPENT** row at the bottom of each sheet.

 Click any transaction hash in Excel and it opens directly in the blockchain explorer so you can verify it.

Privacy & Data Safety

What this tool does

Stores your data locally in your browser only
Works completely offline
Lets you export to your own Excel file

What this tool does NOT do

Send your data anywhere online
Require an account or login
Track, collect or share any information

 **Important:** Your data is saved in your browser's local storage. If you clear your browser data or use a different browser, your transactions will be gone. Export your Excel file regularly as a backup.
